Chapter **1**

Introduction

The goal of this thesis is to prove whether a usage of LiDAR data coupled with images from RGB is useful for the localization of UAVs in contrast to the usage of image data alone. The LiDAR and RGB camera will be mounted on top of the scanner UAV. All the measurements will be taken inside a virtual environment, with a realistic UAV and sensor simulation.

Chapter **2**

Sensors

■ 2.1 Coordinate systems

In order to correctly label the data for training, a position of the second drone in relation to the camera mounted on the first one is required. The API call in AirSim returns a position in relation to its starting point. Therefore a transformation from the starting point of the second drone to the camera mounted on the first one is required. We can write this transformation as follows:

$$\mathbf{T} = \mathbf{T}_{d1}^c \mathbf{T}_{s1}^{d1} \mathbf{T}_{s2}^{s1} \qquad (2.1)$$

insert picture showing the positions of the drones

where:

- $\mathbf{T}_{s2}^{s1}$ is transformation from the starting point of the second drone to the starting point of the first drone

- $\mathbf{T}_{s1}^{d1}$ is transformation from the starting point of the first drone to the body of the first drone

- $\mathbf{T}_{d1}^c$ is transformation from the body of the first drone to the cameras coordinate system

Transformation matrix $\mathbf{T}$ can generally be described as follows:

$$\mathbf{T} = \begin{bmatrix} \mathbf{R} & \mathbf{p} \\ \mathbf{0}^T & 1 \end{bmatrix} \qquad (2.2)$$

ctuthesis t1606152353

where:

- **R** is a 3x3 rotation matrix

- **p** is a 3x1 translation column vector

- $\mathbf{0}^T$ is a 1x3 row vector of zeros

■ 2.2 Camera Model

For the creation of the bounding boxes used for training a transformation from coordinate system of the camera to the pixel values of the image needs to be defined. For this task a pinhole camera model is used. The transformation is then defined as follows:

$$\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} f\frac{x}{z} + c_x \\ f\frac{y}{z} + c_y \end{bmatrix} \tag{2.3}$$

Picture of pin-
hole camera

where:

- x' and y' are pixel coordinate values on the image

- x,y,z are coordinate values of the camera

- f is focal length of the camera

- c_x,c_y are offsets on the image plane

Chapter 3

Dataset

The dataset for this work can be generated in two ways. The first is real-life drone shots mixed with point clouds from LiDAR mounted on top of a drone. The second is generating a dataset using a realistic virtual environment where a drone, camera and LiDAR are being emulated very close to their real-life counterparts. An advantage to this approach is that a great variety of environments can be chosen a lot of them often inaccessible otherwise (power plant, airport, snowy mountains out of season etc.). Therefore this approach will be chosen for the task.

3.1 Unreal Engine

Unreal Engine is a software tool used for creating realistic 3d environments, most often used as a video game engine. It is written in C++ and open-source supporting a variety of pre-built environments and assets. For this work three diferent environments will be used for the creation of the dataset:

  exact name. Snow

-
  exact name. Park

Pictures of the environments

> exact name. City centre

Together

> exact number of pictures

pictures and labels were generated using two drones. One drone was equipped with RGB camera and LiDAR sensor and was responsible for taking the pictures and pointclouds from LiDAR. The second one was used as a model for drone detection.

3.2 AirSim

airsim zdroj

Open-source plugin for Unreal Engine called AirSim was used for the generation of the dataset. It simulates realistic flight motions of drones as well as seven types of sensors , including RGB camera and LiDAR used for this task. AirSim supports both a C++ API as well as Python API, latter which was used for controlling the motion and capturing the dataset. Location of the second drone was generated through API call, which produces a location of the drone in global coordinate system of the map, which is later transformed to the local coordinates of the first drone carrying the LiDAR and RGB sensors.. The capturing drone traveled on each map on a 3d cube grid:

Chapter **4**

Heading on Level 0 (chapter)

Hello, here is some text without a meaning. This text should show what a printed text will look like at this place. $\sin^2(\alpha) + \cos^2(\beta) = 1$. If you read this text, you will get no information $E = mc^2$. Really? Is there no information? Is there a difference between this text and some nonsense like "Huardest gefburn"? Kjift – not at all! A blind text like this gives you information about the selected font, how the letters are written and an impression of the look. $\sqrt[n]{a} \cdot \sqrt[n]{b} = \sqrt[n]{ab}$. This text should contain all letters of the alphabet and it should be written in of the original language. $\frac{\sqrt[n]{a}}{\sqrt[n]{b}} = \sqrt[n]{\frac{a}{b}}$. There is no need for special content, but the length of words should match the language. $a\sqrt[n]{b} = \sqrt[n]{a^n b}$.

4.1   Heading on Level 1 (section)

Hello, here is some text without a meaning. $d\Omega = \sin\vartheta d\vartheta d\varphi$. This text should show what a printed text will look like at this place. If you read this text, you will get no information. Really? Is there no information? Is there a difference between this text and some nonsense like "Huardest gefburn"? Kjift – not at all! A blind text like this gives you information about the selected font, how the letters are written and an impression of the look. $\sin^2(\alpha) + \cos^2(\beta) = 1$. This text should contain all letters of the alphabet and it should be written in of the original language $E = mc^2$. There is no need for special content, but the length of words should match the language. $\sqrt[n]{a} \cdot \sqrt[n]{b} = \sqrt[n]{ab}$.

▪ 4.1.1 Heading on Level 2 (subsection)

Hello, here is some text without a meaning. $\frac{\sqrt[n]{a}}{\sqrt[n]{b}} = \sqrt[n]{\frac{a}{b}}$. This text should show what a printed text will look like at this place. $a\sqrt[n]{b} = \sqrt[n]{a^n b}$. If you read this text, you will get no information. $d\Omega = \sin\vartheta d\vartheta d\varphi$. Really? Is there no information? ZADÁNÍ BAKALÁŘSKÉ PRÁCE

Pro: Tomáš Hejda

Obor: Matematické inženýrství

Zaměření: Matematické modelování

Název práce: Spřátelené morfismy na sturmovských slovech / Amicable Morphisms on
                      Sturmian Words

Osnova:

1. Seznamte se se základními pojmy a větami z teorie symbolických dynamických systémů.

2. Udělejte rešerši poznatků o sturmovských slovech: přehled ekvivalentních definic sturmovských slov, popis morfismů zachovávajících sturmovská slova, popis standardních párů slov.

3. Zkoumejte vlastnosti párů spřátelených sturmovských morfismů, pokuste se popsat jejich generování a počty v závislosti na tvaru jejich matice.
